The Problem...

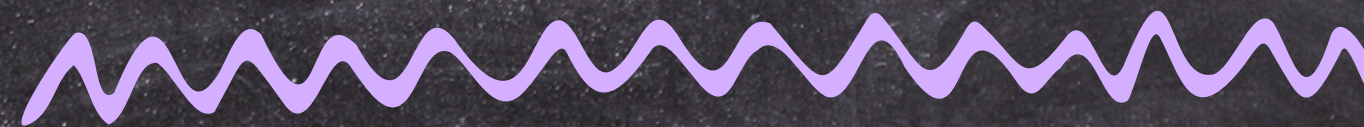

Our Solution - Outlet Map

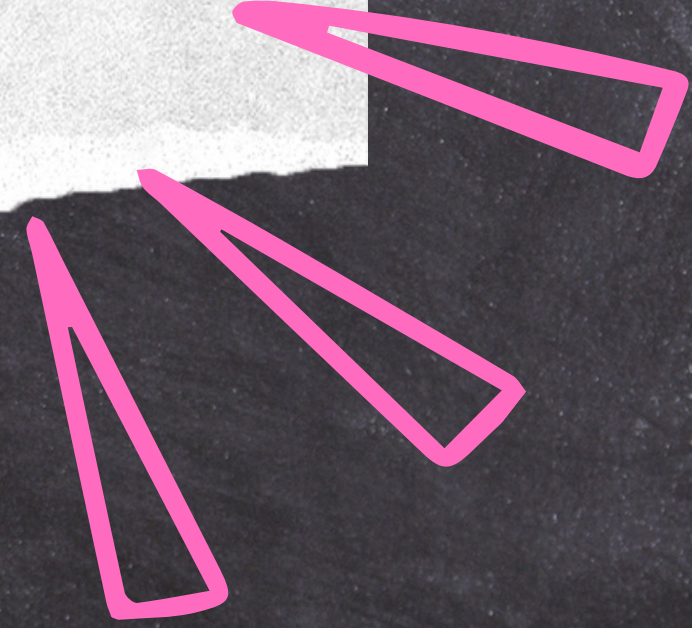

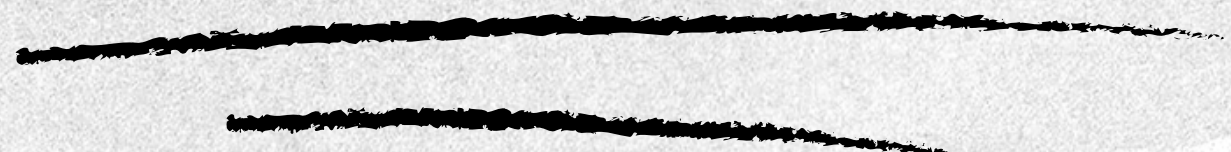

We decided to solve this problem by developing a web application that maps out outlets in NYC. It does this using **user-generated data**.

Users pin locations with available outlets and our program automatically stores longitude and latitude data and generates the matching pin. The app then displays that pin on an **interactive NYC map**.

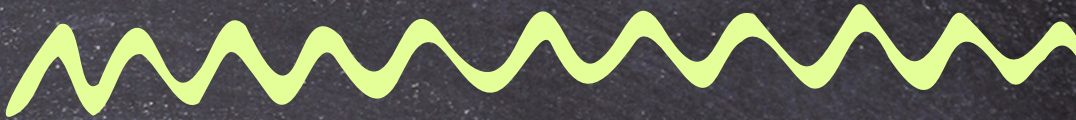

Demo Time!

Project Elements

1

Frontend

Tools used:

- ReactJS Framework

2

Backend

Tools used:

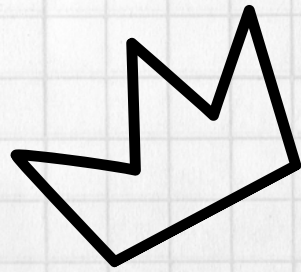

- SpringBoot Framework
- MySQL Database

3

API Routing

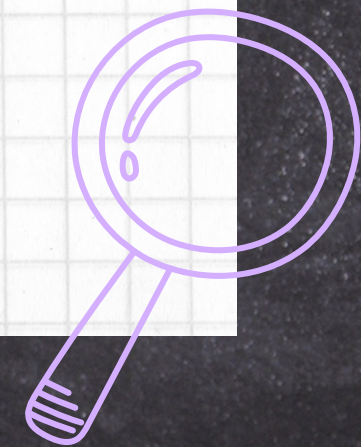

Tools used:

- RESTful API

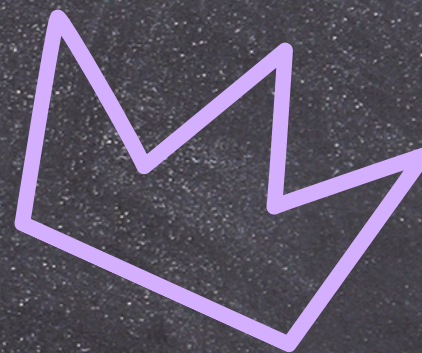

Next Steps

1. Get user feedback and iterate
2. Develop and add necessary features + data fields
 - a. i.e. number of outlets, availability, user groups, etc.
3. Add user logins
 - a. Add new database for user info + tie to existing data points
4. Establish remote connection to MySQL server
